

Figure 1: Additional individual determinants of respondent accuracy. In each panel, the lefthand image shows the marginal effect on accuracy in ROC-space (grey shading represents the 95% bootstrapped confidence ellipse of the predictions from the two models), and the righthand image shows the marginal effect of each individual accuracy measure: the true positive rate, false positive rate, and the overall summary measure of accuracy (Youden's J). Intervals represent 95% confidence levels, calculated via normal approximation for the two rates, and bootstrapped for the J statistic. Religion and indigenous status are shown.
