

Figure 1: Distribution of genetic relatedness scores for the unique pairs of individuals presented in the survey. Scores range from -0.93 to 0.45 where a value of 0.5 would represent relatedness at the level of monozygotic twins. Scores below 0 (red dotted line) indicate individuals who are unrelated. We find that the average level of relatedness is 0.1 , a level between 2nd and 3rd cousins (black dotted line). Moreover, we find that 13.03% of the population of pairs would be considered completely unrelated.
